## Details

The function calculates a D47 value as an intersect of two curves: the equilibrium D47 vs D48 curve from Fiebig et al. (2021) and the kinetic slope. The resulting D47 value is then converted to temperature using the [temp\\_D47\(\)](#) function and the equilibrium D47\_CDES90 vs temperature equation of Fiebig et al. (2021).

**Value**

Returns the carbonate growth temperature (°C). If both D47\_error and D48\_error are specified temp\_D48() returns a data frame.
